# Atividade x COVID

# Brasil

## Usando dados de mobilidade e energia

Utilizamos os dados de mobilidade do Google para montar o índice de atividade, de forma que:

$$Atividade = 0.3886 \cdot Mobilidade + 0.61$$

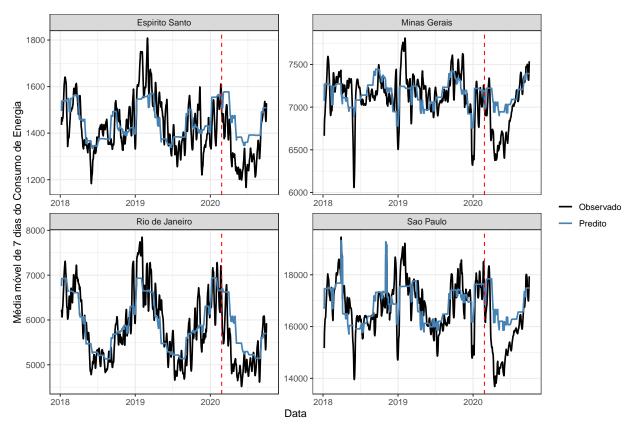

Para definir o contrafactual nos dados de energia, fazemos uma regressão para cada estado e ramo de atividade, com os dados de 08/2018 até 02/2020, da seguinte forma:

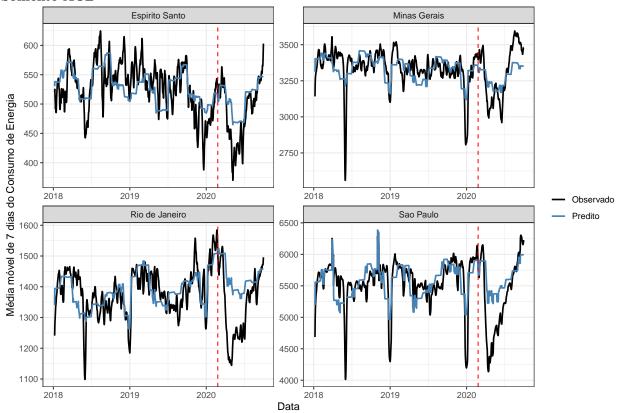

Consumo Diario<sub>t</sub> = 
$$\beta_0 + \sum_{i=2}^{12} \delta_i D_{\hat{\text{mes}}_{it}} + \sum_{i=2}^{7} \lambda_i D_{\text{dia da semana}_{it}} + \sum_{i=2}^{k} \theta_i D_{\text{feriado}_{it}} + \phi t + \epsilon_t$$
 (1)

A partir de 1, usamos os valores preditos para os dados a partir de Março de 2020 como o esperado para o consumo de energia. A diferença percentual mostrada nos gráficos abaixo se baseia nesses valores.
